

Modern Physics, solutions

Problem 1:

(C) **Uncertainty principle**

$\Delta E \Delta t \sim \hbar$, Δt = lifetime of the excited state

Problem 2:

(A) **Bohr atom**

All other answers are incorrect.

Problem 3:

(B) **Dimensions of atoms and nuclei**

You should know typical atomic and nuclear dimensions.

Problem 4:

(B) **The infinite well**

Know the energy eigenfunctions and eigenvalues of the infinite well.

Problem 5:

(C) **Hydrogen atom and hydrogenic atoms**

$E_n = -Z^2 \mu e^4 / (2\hbar^2 n^2)$, μ = reduced mass, E_n scales as $Z^2 \mu$.

Problem 6:

(A) **Hydrogen atom**

$E_n = -E_1/n^2$, longest Lyman: $E_2 - E_1$, longest Balmer: $E_3 - E_2$,

ratio: $(\frac{1}{4} - 1)/(1/9 - \frac{1}{4}) = 27/5$. $\Delta E = hc/\lambda$. Wavelength ratio: $5/27$

Problem 7:

(B) **Photoelectric effect**

$KE = hf - \Phi = hc/\lambda - 2.28\text{eV} = 1240 \text{ eV}\cdot\text{nm}/500 \text{ nm} - 2.28\text{eV} = 0.2\text{eV}$

Problem 8:

(E) **Interpretation of the wave function**

$P = \text{Integral } |\Psi(x)|^2 dx$ from $x = 2$ to $x = 4$

$P = N^2(4 + 9)$

$1/N^2 = (1 + 1 + 4 + 9 + 1)$

$P = 13/16$

Problem 9:

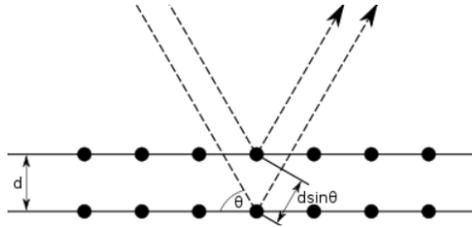

(C) **The infinite well**

The energy levels of the infinite well are proportional to n^2 . The $n = 2$ wave function is shown.

Problem 10:

(D) **Bragg reflection**

$$2d\sin 30^\circ = \lambda = h/p = h/(mv)$$

Problem 11:

(B) **Operators**

In QM every observable is associated with its own operator.

For example: $p_x = (\hbar/i)\partial/\partial x$

Problem 12:

(B) **Bound-state wave functions**

The wave function and its derivative must be continuous, the wave function must go to zero as x goes to infinity. The wave function oscillates in the classically allowed region and decays exponentially in the classically forbidden region.

Problem 13:

(B) **The Pauli exclusion principle**

Problem 14:

(C) **The mean value of an observable**

$$\langle Q \rangle = \langle \Psi | Q | \Psi \rangle = \int_{-\infty}^{+\infty} \Psi^* Q \Psi dx \text{ in coordinate space in 1D.}$$

Problem 15:

(D) **The momentum operator**

$$(\hbar/i)\partial \exp(ikx)/\partial x = \hbar k \exp(ikx)$$
